

1) Program to display current date and time in Java.

Ans : import java.time.*;

```
public class DateTime
{
    public static void main(String args[])
    {
        LocalDate date = LocalDate.now();
        System.out.println(date);
        LocalTime time = LocalTime.now();
        System.out.println(time);
    }
}
```

Output :

```
javac DateTime.java
```

```
java DateTime
```

```
2023-07-22
```

```
10:33:11.025394800
```

2) Write a program to convert a date to a string in the format "MM/dd/yyyy".

Ans: import java.time.LocalDate;

import java.time.format.DateTimeFormatter;

```
public class DateToString
{
    public static void main(String[] args)
    {
        LocalDate date = LocalDate.of(2023, 22, 7);

        DateTimeFormatter formatter = DateTimeFormatter.ofPattern("MM/dd/yyyy");
        String formattedDate = date.format(formatter);
        System.out.println("Formatter Date: "+ formattedDate);
    }
}
```

Output:

```
javac DateToString.java
```

```
java DateToString
```

```
Formatted Date : 07/22/2023
```

3) What is the difference between collections and streams? Give an Example .

- **Ans:**

STREAMS	COLLECTIONS
It doesn't store data, it operates on the source data structure I.e, collection.	It stores/ holds all the data that the data structure currently has in a particular data structure like Set ,List or Map.

They use functional interfaces like lambda which makes it a good fit for programming languages.	They don't use functional interfaces.
Java Streams are consumable I.e, to traverse the stream, it needs to be created every time.	They are non-consumable I.e, can be traversable multiple times without creating it again.
Java Streams support sequential and parallel processing.	It supports parallel processing can can be achieving high performance.
Streams are Iterated internally by just mentioning the operations	Collections are Iterated externally using loops.

Ex. Collections

```
import java.io.*;
import java.util.*;
```

```
class Main
{
    public static void main( String[] args)
    {
        List<String> CompanyList = new ArrayList<>();
        CompanyList.add("Google");
        CompanyList.add("Apple");
        CompanyList.add("Microsoft");
        Comparator<String> com = (String o1,String o2)-> o1.compareTo(o2);
        Collections.sort(CompanyList, com);
        for(String name : CompanyList)
        {
            System.out.println(name);
        }
    }
}
```

Output:

```
Apple
Google
Microsoft
```

Ex.Streams

```
import java.io.*;
import java.util.*;
```

```
class Demo
{
    public static void main( String[] args)
    {
        List<String> CompanyList = new ArrayList<>();
        CompanyList.add("Google");
```

```

        CompanyList.add("Apple");
        CompanyList.add("Microsoft");
        CompanyList.stream().sorted().forEach(System.out.println());
    }
}

```

Output:

Apple
Google
Microsoft

4) What is enum in java? Explain with an example .

Ans: We can use enum to define a group of named constants.

Enums are used to represent a collection of related constants that have a common purpose.

Each constant is an enumeration is an instance of the enum type, and they are typically defined as public static final fields.

Here's an example of how to define an enum in Java:

```

class EnumDemo
{
    public enum DayOfWeek
    {
        MONDAY,
        TUESDAY,
        WEDNESDAY,
        THURSDAY,
        FRIDAY,
        SATURDAY,
        SUNDAY
    }
    public static void main (String[] args)
    {
        for(DayOfWeek d: DayOfWeek.values())
            System.out.println(d);
    }
}

```

Here we define an enum called "DayOfWeek" that represents the days of the week. The enum has seven constants, each representing a day of the week. The constants are defined in all uppercase letters by convention.

5) What are in built annotations in Java

Ans: built-In annotations in Java:

@Override
@Deprecated
@SuppressWarnings
@FunctionalInterface

@Retention

@Target

@Documented

@Inherited

These built-in annotations in Java are used to provide additional information to the Java Compiler and other tools. They help improve code readability, maintainability and safety by enforcing specific rules and behaviours in Java Code.
